

Take the GUESSWORK out of ration construction...

...with NIR TECHNOLOGY.

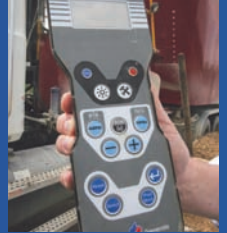

Adjust for Dry Matter at the Batch Mixer in REAL TIME with the FeedScan™ dg precisionFEEDING™ system.

Set Ration Default Values - DTM Feed Management Software

TopScale™ on Mixer Displays Ration Weights and Analysis

Remote Control on Payloader Relays Adjustments

Feed is a dairy farmer's single largest input. It takes an incredible amount of resource to put it in front of cows. Today's ration management has evolved into a fine-tuned science.

The FeedScan dg precisionFEEDING System takes feeding cows to a whole new level! Using NIR technology, every bucket of feed is measured for dry matter before it is dumped into the batch mixer. New adjusted dry matter weights are sent to the operator in real time so that they can load the nutritionist's recommendations for each batch. The result is a ration rapidly adjusted for dry matter fluctuations at every feeding. Reports on crude protein, starch, ash, ADF, NDF and crude fat are also available for daily monitoring and adjustment.

Dry matter adjustment in real time means precise construction for your herd's prescribed ration to prevent over-or under-feeding. Get the most out of your feed and maximize production with the FeedScan dg precisionFEEDING System.

MARKS FARMS | Lowville, New York FeedScan dg precisionFEEDING System

Adjusting DM on a real-time basis has resulted in using less forage while maintaining the target nutrient ratios, helping lower feed costs. Refusals are in the 1-3% range and our milk production has increased. Was less than a 3-month payback.
